ANSWER 1 OF 11 USPATFULL on STN T.3

TIMethods for monitoring multiple gene expression

The present invention relates to methods for monitoring differential AB expression of a plurality of genes in a first filamentous fungal cell relative to expression of the same genes in one or more second filamentous fungal cells using microarrays containing filamentous fungal expressed sequenced tags. The present invention also relates to filamentous fungal expressed sequenced tags and to computer readable media and substrates containing such expressed sequenced tags for monitoring expression of a plurality of genes in filamentous fungal cells.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L3 ANSWER 11 OF 11 BIOTECHDS COPYRIGHT 2005 THE THOMSON CORP. on STN ΤI New integrated plasmid, useful for preparing yeast with high

biotin-productivity used as feed additives, food additives or cosmetics: vector-mediated gene transfer and expression in host cell for strain improvement and feed additive, food additive or cosmetic manufacture

ΑN 2003-20688 BIOTECHDS

AB DERWENT ABSTRACT:

> NOVELTY - An integrated plasmid comprising a biotin synthase gene, an assistant DNA sequence for the integration of the plasmid into a host genome, a promoter sequence, and a selection marker, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following: (1) a method for preparing a yeast with high biotin-productivity comprising constructing the integrated plasmid cited above, linearizing the integrated plasmid, transforming the linearized integrated plasmid into a yeast, and recombining the biotin synthase gene with the yeast genome; and (2) a method for producing biotin comprising providing the yeast with high biotin-productivity, culturing the yeast in a nutrient medium, and recovering biotin from the culture broth.

BIOTECHNOLOGY - Preferred Plasmid: The biotin synthase gene of the integrated plasmid is derived from Saccharomyces cerevisiae or Candida utilis. The biotin synthase gene of C. utilis comprises a fully defined sequence of 1188 base pairs (bp) given in the specification. The assistant DNA sequence is a C. utilis fragment consisting of NsiI-BamHI 18s rDNA, URA3 DNA, or HIS3 DNA. The selection marker is preferably a cycloheximide-resistant gene. The promoter sequence is pL41 promoter of C. utilis or pADH1 promoter of S. cerevisiae. The integrated plasmid is: (A) pMCC21 comprising pL41 for the expression of C. utilis BIO2 gene encoding for 204 amino acids, mutated L41 gene used as cycloheximide-resistant marker, and C. utilis 18S rDNA; (B) pMCC31S or pMCC38S comprising pL41 for the expression of C. utilis BIO2 gene encoding for 233 amino acids, mutated L41 gene used as cycloheximide-resistant marker, and C. utilis 18S rDNA; (C) pMCC32H or pMCC36H comprising C. utilis pL41, C. utilis BIO2 gene, mutated L41 gene used as cycloheximide-resistant marker, and C. utilis HIS3 gene fragment; or (D) pMCC33U or pMCC35U comprising C. utilis pL41, C. utilis BIO2 gene, mutated L41 gene used as cycloheximide-resistant marker, and C. utilis URA3 gene fragment.

USE - The integrated plasmid is useful for preparing yeast with high biotin-productivity. The prepared yeast with high biotin-productivity or recovered biotin is useful as feed additives, food additives or cosmetics (all claimed).

EXAMPLE - Polymerase chain reaction (PCR) was carried out using the Candida utilis BIO2 gene as a template. The product was digested with NdeI and SalI, and ligated into pMC5 to obtain pMCC11. The NdeI-SalI fragment of pMCC11 in which the NdeI nickel was end-repaired into a blunt end by Klenow DNA polymerase (i.e. pL41-BIO2 fragment) was ligated into pMC9 to obtain pMCC15. To fill the lost L41 fragment, the BamHI-EcoRI fragment of pMC9 (i.e. L41 gene fragment) was end-repaired into a blunt end by Klenow DNA polymerase and then integrated into the SalI site in pMCC15 to obtain pMCC21. The plasmid pMCC21 comprises C. utilis pL41 for the expression of the C. utilis BIO2 gene, mutated L41 gene used as cycloheximide-resistant marker, and C. utilis 18S rDNA. (20 pages)

ANSWER 4 OF 8 USPATFULL on STN 1.6

тT Baker's yeast and a method producing it

A process is disclosed for the production of baker's yeast which AB comprises the fermentation of a baker's yeast strain using a non-molasses carbon source until a fermentation broth having at least 10%, preferably at least 13%, more preferably at least 16% of dry solids

content is formed, which can be used directly as a cream yeast without concentration.

1.6 ANSWER 5 OF 8 USPATFULL on STN

ТT Production of distillers yeast

AB Distillers yeast is produced by a process which results in more rapid yeast growth, higher cell concentrations and greatly extended yeast viability. The process involves propagating yeast on a culture medium of cooked cereal grain mash which has been subjected to enzymatic action of glucamylase obtained from fungi of the genus Aspergillus. After propagation, as a result of substantially longer viability, the yeast can be stored in the culture medium for up to 3 days or longer with portions being withdrawn from time to time for inoculating distillery grain mashes.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

ANSWER 6 OF 8 WPIDS COPYRIGHT 2005 THE THOMSON CORP on STN

Bread-baking yeast preparation - involves adding aryl-thioacetic acid derivs. TIto des thio-biotin used in molasses-based nutrient medium for yeast cultivation.

1988-159690 [23] WPIDS AN

1350172 A UPAB: 19930923 AB

The bread-baking yeasts are obtd. by multistage cultivation under aeration conditions on a nutrient medium containing molasses, mineral salts and desthiobiotin. During the stages of production of yeast inoculant and commercial yeasts, derivs. of arylthio (sulphonyl) acetic acid are added in amount (1-10000)x10 power minus 10% jointly with desthiobiotin.

The specified derivs. are 2-hydroxyalkyl-ammonium salts of formula (I), where (a) R=H, R2=4CH3, n=2 and X=N+H3CH(CH2OH)CH(OH)C6H4NO2-4; (b) R1=H, R2=4Cl, n=O and X=N+H(CH3)2CH2CH2OH; or (c) R1=H, R2=4Cl, n=2, and X=N+H (CH2CH2OH) 3.

(I) contain metabolically active sulphur which can be incorporated into desthiobiotin and form biotin. (I) also act as antioxidants by lowering the intensity of peroxide oxidation of lipids of biological membranes.

USE/ADVANTAGE - In the microbiological industry. Increased biomass yield is obtd. Bul.41/7.11.87

TI Yeast prepared by culturing Hansenula ofunaensis - in medium containing methanol, ethanol and/or glucose as carbon source.

AN 1978-02953A [02] WPIDS

AB JP 52139773 A UPAB: 19930901

The method is characterised by culturing a novel yeast stock Hansenula of unaensis (FERM-P 3494). The yeast stock Hansenula of unaensis can utilise methanol, ethanol and glucose, which are favourable as the starting material for preparing yeast for food use.

The culture is practiced aerobically at 10-41 pref. 30-39 degrees C in the medium containing methanol, ethanol and/or glucose as carbon source at pH 2-9 pref. 3-7 for up to 6 days. As the growth promoter vitamins such as thiamine, biotin, etc. and amino acid such as methionine, cysteine, etc. can be applied. After the culture yeast body is separated washed and dried.

ACCESSION NUMBER:

- TI Yeast preparation using Torulopsis methanothermophilus in culture medium containing methanol as carbon source and **biotin**.
- AN 1977-19283Y [11] WPIDS
- AB JP 52015882 A UPAB: 19930901

Method is effected by inoculating a stock belonging to Torulopsis methanothermophilus which can utilize methanol, into a culture medium containing methanol as carbon source and **biotin**, culturing it for multiplication and separating the yeast body.

The stock can multiply at high temperature and low pH and is considered a novel stock. The stock is trusted to Institute of Microbial Industry with the Trust Number 3158. As teh carbon source crude methanol which contains small amount of lower aldehydes, lower alcohols, etc. can be used. With methanol concentrate >4% the growth of the yest is inhibited, so methanol is added to the culture medium little by little.

The genome sequence of Schizosaccharomyces pombe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequencing project, Sanger Institute, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, E-mail: pombe@sanger.ac.uk and AGOWA GmbH, Glienicker Weg 185, D-12489 Berlin, Germany On Apr 14, 1999 this sequence version replaced gi:2995362.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Details of S. pombe sequencing at the Sanger Institute are available on the World Wide Web.

(URL, http://www.ganedb.org/genedb/pombe/index.jsp) (URL, http://www.sanger.ac.uk/Projects/S.pombe/)

CDS are numbered using the following system eg SPAC5H10.01c. SP (S. pombe), A (circomosome 1), c5H10 (coemid name), .01 (first CDS), c pombe), A (circomosome 1), c5H10 (coemid name), .01 (first CDS), c lcomplementary strand) However, clones may have been reorientated since the original submission, therefore the complementary strand notation may be invalid for strand inference. IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once location.

    .7687
/note="nominal overlap with cosmid SPCC330, EM:AL031603 S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wood, V., Rajandream, M.A., Barrell, B.G., Wedler, H., Wambutt, R. and Wedler, E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aspect=P; term=threonine catabolism; GOid=GO:0006567;

(URL, http://www.genedb.org/genedb/pombe/index.jsp) (URL,

ttp://www.sanger.ac.uk/Projects/S_pombe/)

CDS are numbered using the following system eg SPACSH10.01c. SP (S. pombe), A (chromosome 1), c5H10 (cosmid name), ol (first CDS), c

[complementary strand). However, clones may have been reorientated since the original submission, therefore the complementary strand notation may be invalid for strand inference. IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once. Location/Qualifiers

    .2935
'note="nominal overlap with cosmid SPCC320, EM:AL022245 S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note="smr domain protein (small muts related protein); DNA repair related; no apparent orthologs"

This 5TS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazii, Zygosaccharomyces rouxii, Saccharomyces kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces lactis war. lactis, Rluyveromyces maxxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarromia lipolytica. Genomic inserts of 3 to keywords for description of this sequence and for the sequence of the other extremity of this insert.

The present invention relates to a yeast with high biotin-productivity and a method for its preparation. The yeast is transformed by an integrated plasmid, which includes the edible yeast (Candida utilis) biotin synthase gene, an assistant DNA sequence for the integration of the plasmid into a host genome, a promoter sequence, and a selection marker. The prepared yeast with high biotin-productivity or recovered biotin is useful as feed additives, food additives or cosmetics. The present sequence represents C. utilis biotin synthase gene.

The invention relates to a novel method for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The method comprises modifying the alleles of a gene in diploid fungal cells method comprises modified. The recombination using a gene disruption cassette and a promoter captacement fragment. The invention further comprises assembling a collection of diploid fungal cells each of which comprises modified alleles of a gene, where the first allele of the gene is modified alleles of a gene, where the first allele of the gene is requence encoding an expressible selectable marker; and the expression of the second allele of the gene is regulated by a heterologous promoter that is operably linked to the coding region of the second allele of the gene is regulated by a heterologous promoter that is operably linked to the coding region of the second allele of the gene encodes the polypeptide mentioned above; a collection of diploid fungal strains comprising the diploid strains cited above, where substantially all the different genes that encode the above amino acid sequences are modified and are present in different diploid arrains in the collection; a nucleic acid molecule microarray comprising nucleic acid molecules, where each nucleic acid molecule comprising any of the 310 nucleotide sequences listed in the comprising any of the 310 nucleotide sequences listed in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Constructing a strain of diploid fungal cells in which both alleles of a gene are modified comprises modifying the alleles of a gene in the fungal cells by recombination using a gene disruption cassette and a promoter

contributes to the survival or growth of a fungue, that contributes to the resistance of a diploid fungue to that contributes to the resistance of a diploid fungue, for that contributes to the resistance of a diploid fungue, for that contributes to the resistance of a diploid fungue to that contributes to the resistance of a diploid fungue, for a purification of growth or proliferation of a diploid fungal esquence encoding a gene product genet for treatment of a mammalian disease; correlating changes in the cacid molecule comprising a mammalian cell; a purification of growth or proliferation of a diploid fungal cell; a purification of growth or proliferation of a diploid fungal cell; a purification of solution of cacid molecule comprising a promoter operably linked to the nucleic acid molecule comprising a promoter operably linked to the nucleic acid molecule comprising a promoter operably linked to the nucleic acid molecule comprising a promoter operably linked to the nucleic acid molecule comprising of the final molecule and sequences given in the specification (MD96/19-AD96/79); a fusion protein comprising a fragment consisting of at least 6 consecutive residues of any of AD98826-AD99915; consisting of a least formed any molecule acid comprising any of AD99915.

Candida albicans, where a first allele of a gene comprising any of AD99915.

Candida albicans, where a first allele of a perconduct and accomplishing a compound which modulates the activity of a heterologous promoter; identifying a compound or binding control of a heterologous promoter; identifying a compound or binding confidence or a bloid and albicans, where a first allele of the spolyceptic or preventing or inhibit grown or proliferation of a subject by Candida albicans; or for preventing or inhibit subjects of a negativity or level of a pertapeutic amount of an agent which reduces the activity or level of a pertapeutic amount of an agent which reduces the activity or level of AD99915; methods an intended by a computer and aspect of composition a useful for identification and validation of gene products as effective targets for therapeutic intervention, for identifying and validating gene products as effective targets for therapeutic intervention, and for collecting identified essential genes. This polynucleotide sequence represents a Candida albicans fungal specific gene of the invention.

NOTE: This sequence was downloaded from an electronic sequence listing specification (ADP98516-ADP98825); identifying a gene that is essential to the survival or growth of a fungus, that contributes to the virulenc provided on the WIPO website. 

Sequence 1125 BP; 362 A; 218 C; 242 G; 303 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of biotin synthase enzymes from barley, wheat, maize, soybean and the prickly poppy. These sequences can be used to produce transgenic plants which express different levels of the gene, or express it at different times in plant development. They can also be used as a target in the production of herbicides. The present sequence is a soybean biotin synthase CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                292

                                                                                                  The invention relates to a novel isolated polynucleotide encoding a first polypeptide or a third polypeptide where the first or third polypeptide is a biotin synthase. The methods and compositions of the invention may be useful in plant molecular biology and breeding, particularly in the production of altered levels of biotin synthase in plants and seeds. The polypeptides may be used as a target to facilitate the design and/or identification of inhibitors of these enzymes that may be useful as herbicides. Furthermore, the polypurcleotides may be used as probes for genetically and physically mapping the genes of which they are a part. The current sequence is that of the soybean biotin synthase-related cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TCTATGATAAGCCATTGATGGAGTTATGTTGGGGTGCTGGTAGTTTGCACAGGAAATTCC 353

Fragments of the encoded protein can be used as the amphibhlic peptides used in the marroscopic membrane (MM) of the invention. The MM is formed by self-assembly of the amphibhlic peptides (see AAM30219-W3033) in an aqueous medium containing monovalent metal cations. The MM are stable in serum, are non-yetotoxic, and are useful in biomaterial applications, such as medical products (e.g. sutures), or internal linings. The MM are useful as slow-diffusion drug delivery vehicles for protein-type drugs, including

erythropoietin, tissue-type plasminogen activator, synthetic haemoglobin and insulin. They can be used in applications, such as separation matrices (e.g. dialysis membranes). Collagen may be combined with the peptides to produce membranes for use as artificial skin. The MM may be used for making very thin, transparent fabric. Drugs which inhibit the self assembly of the peptides into filaments or filamentous membranes may be useful for treating Alzheimer's disease or scraple infection. As they as receistant to proteolytic digestion and alkaline and acidic, pH (such as remach acid), drug delivery vehicles made of the MM could be taken orally. The charged residues and conformation of the MM promote cell as dhesion and migration. The permeability of the MM also permits diffusion of small molecules, to the underside of cell monolayers, useful for tissue culture of differentiated cells and/or stratified cell layers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ATGCCAACGTCTATTATCAGATTGGCTGCAGGAAGATATACAATGAAAGAGGCAGAACAG 1023

This sequence encodes the human zuotin (ZUO1) protein. Fragments of the protein can be used in the in vitro method of the invention. The method of the self-assembly of amphiphilic peptides. The peptides are salt-induced to form insoluble and protease-resistant protein filaments with a beta-sheet secondary structure. The membranes may be may be useful in a wide variety of medical, research, industrial and blomaterial applications such as slow-diffusion drug delivery systems, artificial skin and separation matrices. The membranes may be used to support in vitro cell attachment and growth and for supporting artificial tissue (e.g. for in circase minglants). They are particularly useful as experimental or vivo use as implants). They are particularly useful as experimental crowing artificial tissue (e.g. for in disease modelling experiments and scrapic infection and so may be used in disease processes. Additionally, they may be used in this way to study liver cirrhosis, kidney amyloidosis and other protein conformational diseases. The membrane in the membrane/cell mixture produced in the method: (i) supports cellular attachment and growth; (ii) self-assembles to form large, macroscopic membranes that are insoluble conditional adueous solutions, serum and ethanol; (ii) is and stable in a queous solutions, serum and ethanol; (iii) is a highly resistant to heat, alkaline/acidic phs. chemical denaturants and conformational and processing serum and ethanol; (ii) may conformational maked eye if qwed but is otherwise transparent; (v) is conformational maked eye if qwed but is otherwise transparent; (v) is conformational maked eye if qwed but is otherwise transparent; (v) is conformational maked eye if qwed but is otherwise transparent, (v) is which the setulation of the protein of the pr

The invention relates to a macroscopic membrane formed by self-assembly of amphiphilic peptides in an aqueous solution containing monovalent metal cations. The peptides have alternating Mydrophobic and hydrophilic amino acids and are complementary and structurally compatible. The membranes are useful as biomaterial for medical products (e.g. sutures, artificial skin, internal linings), as vehicles for slow-diffusion drug delivery (preferably for protein type drugs e.g. erythropoietin, tissue type plasminogen activator, synthetic haemoglobin and insulin), as separation matrices (e.g. dialysis membranes, chromatography columns, filters for the removal of viruses and other microscopic contaminants), for other uses requiring permeable and water-insoluble material (e.g. for culturing cell monolayers including differentiated cells and/or stratified cell layers), for the preparation of very thin and transparent fabric and as a model system for investigating the properties of biological protein structures and providing insights into the pathology and proteins compassing structures (e.g. Alzheimer's disease, scrapie infection and in origin of life studies related to cell membranes and cellular comparatentalisation). The present sequence is yeast zuctin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                186 Grccaagaarcregaaraaagccreraceereererarrregercreereaaagcgaa 245
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     66 AAGCAATTGAAAGATGCAGGTTTGACTGCATACAACCATAACATCGACACTTCCAGAGAA 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Macroscopic membrane useful in biomaterial applications e.g. sutures is formed by self-assembly of amphiphilic peptides in an aqueous solution containing monovalent metal cations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           553 GTCCATGACCTTGGAATGGAGAGTTGTGTCACCCTGGGAATGGTTGATAAAGACCAAGCC
